

BARD VENTURES LTD.
(CBS : TSX-V : \$0.15 | NOT RATED)

Bard Ventures Ltd. released drilling results last week from its 100%-owned Lone Pine molybdenum project, located 15 kilometres northwest of Houston, BC. Vertical borehole BD-08-29 intersected 520 metres of 0.11% molybdenum (Mo), starting at 229 metres downhole. This borehole was designed as a 100 metre northwest step out from borehole BD-08-25 (released in March 2008), which intersected 730.9 metres of 0.10% Mo. Borehole BD-08-28, a 50 metre northwest step-out from BD-08-25, was released on April 17, 2008, and intersected 730 metres of 0.10% Mo.

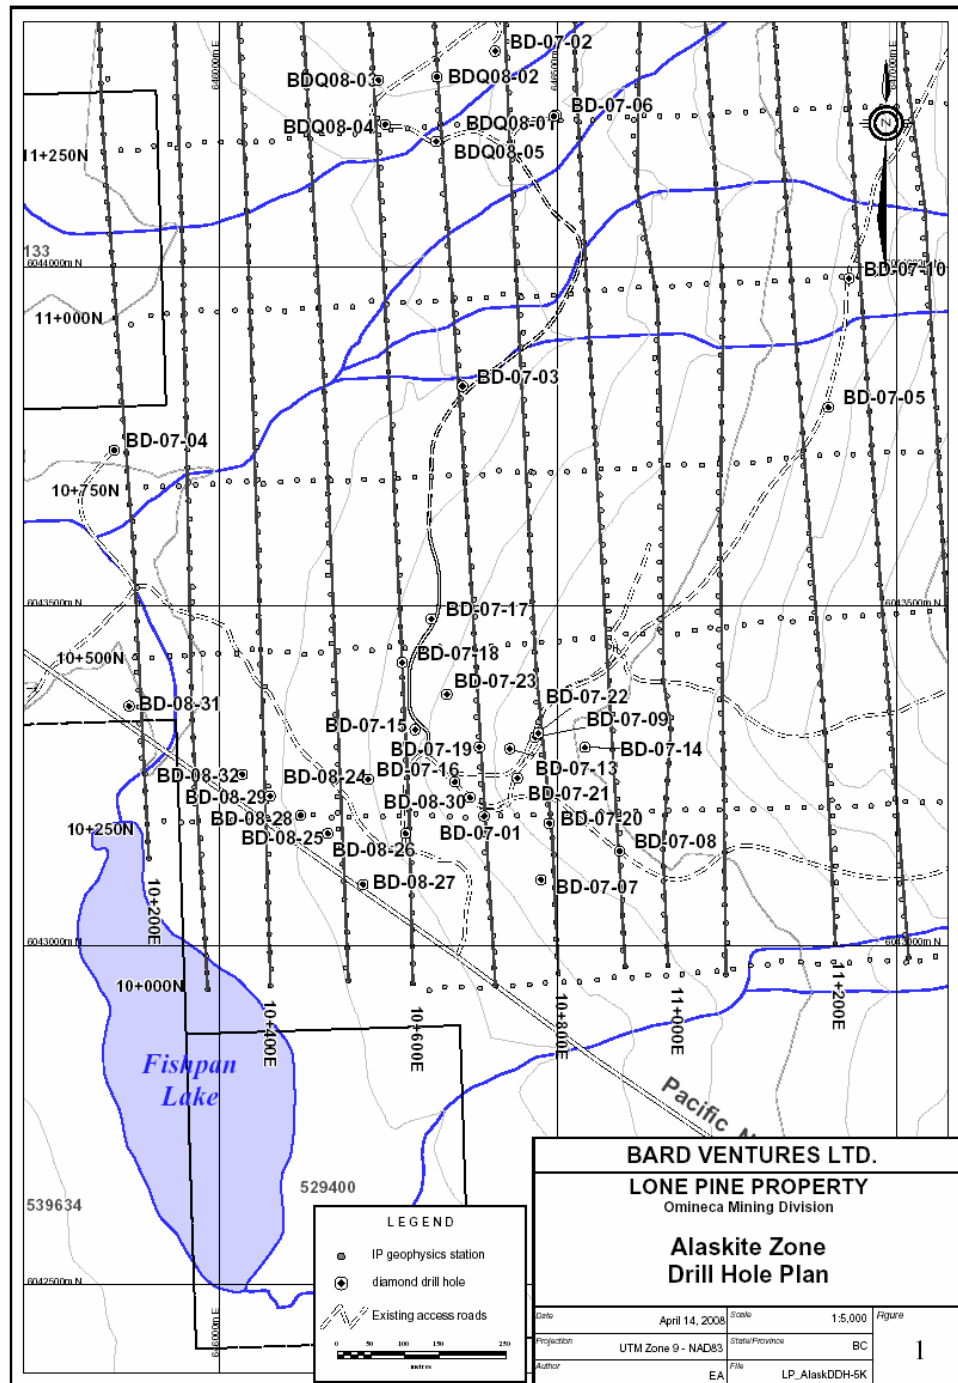

At Lone Pine, Bard is focusing its exploration efforts on delineating the outline of the alaskite intrusive, which the company feels is the most favourable lithology for molybdenum mineralization. To date, the alaskite intrusive has been traced along a 300 metre northwest-southeast strike length with true widths up to 210-270 metres to a vertical depth of 843 metres. Boreholes BD-08-32 and BD-08-31 (assays pending) have the potential to increase the implied strike length to the northwest by an additional 250 metres. The company is interpreting that the alaskite intrusive forms a tabular body, dipping 65-75° to the southwest. The alaskite body outcrops at surface along its strike length and appears to increase in thickness towards the northwest. The alaskite body cuts an andesite unit which forms both the hanging wall and footwall of the alaskite and hosts lower-grade Mo mineralization. Beneath the andesite lies a barren quartz feldspar porphyry.

In 2007 Bard completed 3D Induced Polarization (IP) and magnetic surveys at Lone Pine, which indicate that chargeability and resistivity anomalies show good correlation with drilling results to date. The company indicates that a number of geophysical targets on the property have yet to be tested.

The Lone Pine Property consists of seven mineral claims covering 1,051 hectares. The site is less than 1 kilometre from paved road access and power is within 1.5 kilometres. Bard currently has two diamond drilling rigs operating on the property and has another 18,000 to 21,000 metres of drilling in 25 to 30 holes planned for 2008.

Bard has an option agreement to acquire a 100% interest in the Grouse Mountain property, which consists of seven mineral claims adjoining the Lone Pine property. Historical data compilation has been completed and will be integrated with results from the IP and magnetic surveys prior to the selection of drill targets.

Bard has a 50% interest (JV with Selkirk Metals Corp. (SLK : TSX-V : C\$0.38 | Not rated) in the Wasi Creek Zn-Pb-Ag property, located 150 kilometres northwest of Mackenzie, BC. Bard is funding exploration on the property under the terms of the agreement to earn its 50% interest. Selkirk is the operator of the program. Historical drilling results on the property include: 6.35% zinc, 1.07% lead and 16.5g/t silver over 4.8 metre and 4.98% zinc, 0.68% lead and 18.0 g/t silver over 5 metre. Boulder sampling on the property by Selkirk has returned values as high as: 26.30% zinc, 25.98% lead and 96.3 g/t silver and 8.46% zinc, 42.43% lead and 384.8 g/t silver. An airborne EM geophysical survey was completed on the property in May 2005 to identify conductors that may be the source of these massive sulphide boulders. Diamond drilling in 2006 failed to intersect the source of the boulders. An exploration program consisting of soil and rock sampling in conjunction with ground electromagnetic (EM) and magnetic surveys is currently planned for the summer of 2008 at Wasi Creek.

Bard also has a 50% interest in the 2784 hectare Opikeigen project in northwestern Ontario. Bard's JV partner, SLAM Exploration (SXL : TSX-V : C\$0.13 | Not rated) is the operator and commenced a 1,200 metre drilling program at the Fort Hope Gold Mine on
